INDRODUCTION-

The Student Digital Ambassador position requires students to develop a Digital Literacy Portfolio for their work. The project enables students to learn digital tool operation and digital safety practices which they can use to develop their professional web appearance and maintain correct digital interaction. The project consists of five separate tasks which focus on different essential aspects including infographic-based awareness and portfolio development and platform discovery and email professional standards and cybercrime protection.

Through this scenario, I acted as a guide for my peers, learning how to present digital concepts in a simple and practical way. The project enabled me to enhance my technical abilities and communication competencies while teaching me about proper digital conduct which applies to both educational settings and actual professional environments.

Task 1 - Create a Digital Literacy Awareness Infographic

The infographic I developed shows essential digital literacy components which include internet safety rules and proper email handling and complete digital literacy knowledge. The design uses sections and icons and brief points to display information in an organized way which helps students understand and remember the content.

I used Canva to design the infographic because it is a free and easy-to-use tool with many templates and design elements. It helped me quickly arrange text, images, and icons in a neat and attractive format.

During my work on this infographic I observed how visual elements enable people to understand difficult concepts in an appealing manner. I needed to handle complicated information while keeping the design minimalistic without creating too many elements which became difficult for me. The assignment helped me learn about digital literacy while teaching me to create visual information through creative methods.

Task 2 - Build Your Student Digital Portfolio

Project Report: Professional Digital Presence

I created profiles on GitHub and LinkedIn and Kaggle to establish my professional online presence for this assignment.

These platforms serve different purposes. The platform GitHub allows me to store code while managing its development which lets me display my work and monitor my programming achievements. LinkedIn functions as a professional networking site which enables me to display my academic qualifications while I build professional relationships and search for job openings. The platform Kaggle operates within data science and machine learning fields which enables me to analyze datasets and join competitions while developing my data analysis and problem-solving abilities.

I will maintain my GitHub repository through regular updates of fresh projects and real-world assignments while I use LinkedIn to establish professional relationships and distribute my professional accomplishments. I will use Kaggle competitions to build my technical abilities through ongoing competition participation. These platforms will enable me to establish a professional portfolio and gain industry experience which will improve my chances of securing employment during the upcoming four years.

Task 3 - Explore Coding & Collaboration Platform Google Workspace Collaboration

Project Report: For this task, I used Google Forms and Google Sheets as the primary platforms for collaboration and data management. These tools allowed me to efficiently create, share, and analyze information in a structured and professional manner.

I built a Digital Literacy Awareness Quiz using Google Forms, consisting of five questions that included both multiple-choice and short-answer formats. The experience allowed me to develop my questionnaire design abilities through creating clear and pertinent questions which users would find interesting to answer. I also learned how to structure questions to assess awareness of digital tools, online safety, and responsible internet usage.

I used Google Sheets to develop automated response collection systems which transformed form data into organized tables. The process enabled me to actively work with tabular data displays while I discovered response trends and learned about digital solutions which enhance data processing methods.

Overall, this task helped me develop practical skills in creating surveys, managing data, and using cloud-based collaboration platforms, which will be highly useful for academic projects, research work, and teamwork

Task 4 PART B - Draft a Professional Email & Etiquette Guide — Social Media Do's and Don'ts checklist

Project Report:
Communication Scenario:
A student in a college group project chose to resolve his frustration about a lazy teammate by sending a group chat message to address the issue. The message contained a disrespectful and unprofessional style which attacked the teammate in front of their colleagues. The situation became worse because it lacked any form of constructive feedback or proper explanation. The teammate experienced public humiliation which made them feel disrespected so the team developed internal conflicts. The team members stopped working together because their communication became unproductive which resulted in declining teamwork performance and inferior project results.

Key Learnings:
Digital communication requires users to select suitable channels while they should maintain professional conduct during online discussions. People need to discuss sensitive matters away from public settings because this approach protects their dignity and prevents fights. The messages need to combine solution-based content with polite communication and clear language instead of pointing fingers at others. The process of message review needs people to check their content before distribution because it helps them choose appropriate words which others can read correctly. Digital communication will enhance through empathy practice because people learn to recognize how their words affect others which results in improved relationships between colleagues and stude

TASK 5 - Cybercrime Awareness Case Study & Prevention Guide

Project Report (Reflection on Cybercrime Awareness Task)

During my cybercrime research I found that attackers use straightforward methods which successfully deceive people through phishing and UPI fraud schemes. I discovered that cybercriminals choose to use basic methods instead of complex technology because they are able to manipulate human reactions which include feelings of urgency and fear and trust. A fake message which appears to come from a bank or payment app will deceive even users who have knowledge about security. Users can lose money through UPI scams at a fast rate while facing significant challenges when they attempt to retrieve their stolen funds.

Users must develop a habit of checking all links and payment/account verification messages before they respond or click on any of them. I will always verify the source, double-check URLs, and avoid sharing OTPs or personal details under any circumstances.

CONCLUSION

Through this project I discovered that digital literacy requires users to handle technology with both responsibility and effective operation. I learned to create a professional digital presence while mastering formal email communication and academic platform usage through GitHub and Google Forms. The experience taught me better methods to protect myself from cyber threats which were revealed through the online safety training. The assignments provided me with actual workplace experience which I will need for my upcoming internships and professional work. The project helped me build digital tool confidence which made me ready to teach others about digital safety as their Digital Ambassador.
